

Vacuum Forming Update- New Product Development

Recently our Vacuum Formed Plant has developed a new formulation for our Low Density (LD) 2300 product that will be offered immediately to all of our customers.

This improved mix will enhance the properties of the entire line. LD 2300 can now

be compared to the board products in the market with the same density. It is a rigid self-supporting product that can be made in different sizes and thicknesses.

The LD 2300 is white in color with increased hardness and a higher MOR. The temperature limit for this product is 2100°F and can be used in all industrial or appliance applications. LD 2300 can be easily cut into shapes with a band saw or water jet for specific applications.

This product will now be manufactured for all Low Density 2300 Board requirements. If you have any questions, please contact your local Nutec representative
